EUROS opens new production hall for onshore rotorblades

Berlin/Żory-Warszowice, 19 June 2013 – With today’s opening of its expanded production facility in Żory-Warszowice, Poland, EUROS, the independent rotor blade developer and manufacturer, has increased its production capacity for onshore rotor blades in Poland’s south west by a factor of five. The new production site has a production area of over 14,000m² and is equipped with the newest technology and the highest environmental standards. It will be utilised for the serial production of rotor blade types EU116 and EU120, which are used on 3MW wind turbines. The new investment with an estimated cost of around 10 Million Euros was made possible by subsidies from the EU and the Polish Ministry of Economics as well as funding by the Polish bank Zachodni WBK S.A.

“The EU’s and Polish subsidies show the trust that is put into our work. With the expansion of our capacities we will be ideally prepared for orders of significant volume in the future,” said Dr Michael Wolf, CEO of EUROS, during the opening ceremony. International business partners as well as guests from economy and society were invited to the event. Dr Wolf’s opening speech and the official key presentation to Mariusz Duda, Plant Director of EUROS Polska, were followed by a tour of the new hall together with the invited guests. The ground-breaking-ceremony for the site-expansion in Żory-Warszowice took place in 2012. Before that, the first expansion stage has been used primarily for the manufacturing of smaller rotor blades and production tools for EUROS’s own demand since its construction in 2008.

The opening of the new hall is already the second highlight EUROS is presenting within a time span of less than four weeks: At the start of May, one of the biggest offshore rotor blades in the world with a length of 81.6m has been successfully built and shipped from Sassnitz, Rügen.

EUROS was founded as a development office in Berlin, Germany, in 1996. In 1999, EUROS Polska was founded and the first production site was opened in Ustroń in the South of Poland. The second production site in Żory-Warszowice opened in 2008. The wind turbine rotor blades are developed in Germany, manufactured in high quality in Poland and Germany and will be delivered worldwide, e.g. in the USA, Venezuela, Argentina, India, China, Korea and Japan. EUROS offers its customers a wide range of rotor blades that are tailored to their specific requirements.
